

BRAINSTORMING & IDEATION PHASE

1. Problem Identification

Users frequently ask common and repeated questions and expect quick and accurate answers. Searching for answers manually can take time and may not always provide the required information clearly. The idea of the **FAQ Assistant API** is to provide an assistant that can understand frequently asked questions and return suitable answers through an API.

2. Idea Generation

During the brainstorming stage, the following idea was identified:

- Develop an **FAQ Assistant API**.
- Allow users to ask frequently asked questions.
- Process the user's question through the API.
- Provide a relevant and appropriate answer.
- Make the system accessible through API requests.
- Provide a simple and efficient way to handle common questions.

3. Proposed Idea

The proposed idea is to develop an **FAQ Assistant API** that acts as an assistant for answering frequently asked questions. The user sends a question to the API. The system processes the question and provides the corresponding answer as the response. This reduces the need for manually searching for answers and provides a simple interaction between the user and the system.

4. Initial Concept

User Question → FAQ Assistant API → Process Question → Generate/Find Answer → API Response

The brainstorming and ideation phase helped to define the basic concept, purpose, and functionality of the **FAQ Assistant API**.
