

PROJECT DESIGN PHASE

1. System Architecture

The FAQ Assistant API is designed as an API-based system in which the user sends a question, the API processes the request, identifies the suitable answer, and returns the response to the user.

User → API Request → FAQ Assistant → Answer Processing → API Response

2. User Interface Design

The system is designed to provide a simple interaction for users. The user can submit a frequently asked question and receive the answer through the API response.

3. API Design

The API acts as the communication layer between the user or client application and the FAQ Assistant. It receives the user's question through a request and returns the processed answer as a response.

- Accept user questions through API requests.
- Process the received request.
- Return the appropriate answer.
- Provide a structured API response.

4. Data Design

The system is designed to handle the information required for frequently asked questions and their corresponding answers. The data structure supports retrieving suitable answers based on the user's question.

5. Module Design

- **Question Input Module:** Receives the user's question.
- **Request Processing Module:** Processes the API request.
- **FAQ Processing Module:** Handles the question and identifies the suitable answer.
- **Response Module:** Sends the answer back to the user through the API.

6. Design Outcome

The project design phase defines the overall structure, API interaction, data handling, and major modules of the FAQ Assistant API. This design provides a clear foundation for the implementation phase.
