

REQUIREMENT ANALYSIS PHASE

1. Functional Requirements

The FAQ Assistant API should provide the basic functionality required to receive user questions, process them, and return suitable answers through an API.

- The system should accept questions from users through an API request.
- The system should process the received question.
- The system should identify the appropriate answer for the question.
- The system should return the answer as an API response.
- The API should provide a simple method for interacting with the FAQ Assistant.

2. Non-Functional Requirements

The system should be simple to use and should provide responses in an efficient and understandable manner.

- Simple and user-friendly API interaction.
- Fast response to user questions.
- Reliable processing of requests.
- Clear and understandable responses.
- Easy integration with applications that use the API.

3. Hardware Requirements

- Computer or laptop.
- Internet connection.
- Sufficient storage for the project files.

4. Software Requirements

- Programming environment required to develop the API.
- API development framework/environment.
- Database or data storage required for FAQ information.
- Web browser for testing and accessing the API.
- API testing tool for sending requests and checking responses.

5. User Requirements

The user should be able to send a frequently asked question to the API and receive the corresponding answer.

6. Requirement Analysis Outcome

The requirement analysis phase defines the basic functional, non-functional, hardware, software, and user requirements needed for developing the FAQ Assistant API. These requirements provide a clear foundation for the next stages of the project.
